EXPERIMENT 5 – INFORMATION EXTRACTION USING spaCy

Learning Objectives

The objective of this experiment is to understand and implement information extraction techniques on unstructured customer review text using the spaCy Natural Language Processing library. The experiment involves loading and cleaning the Amazon Fine Food Reviews dataset, performing text preprocessing, extracting tokens and lemmas, identifying Part-of-Speech (POS) tags, performing Named Entity Recognition (NER), and organizing the extracted information into structured formats for further customer feedback analysis.

Libraries Used / Purpose

- **Pandas** – Used to load, clean, manipulate, and organize the customer review dataset using DataFrames.
- **spaCy** – Used for NLP processing, tokenization, lemmatization, POS tagging, and Named Entity Recognition.
- **Collections.Counter** – Used to count the frequency of different POS categories.
- **Google Colab Files** – Used to upload and access the Amazon Fine Food Reviews dataset.

Program Code

```
!pip install -q spacy
!python -m spacy download en_core_web_sm

import pandas as pd import
spacy from collections import
Counter from google.colab
import files

nlp = spacy.load("en_core_web_sm")

print("spaCy version:", spacy.__version__) print("spaCy
model loaded successfully")

uploaded = files.upload()

filename = list(uploaded.keys())[0] df
= pd.read_csv(filename)
```

```
print("\n--- First 5 Records ---") display(df.head())

print("\n--- Dataset Shape ---") print(df.shape)

print("\n--- Column Names ---") print(df.columns.tolist())

reviews = df[['Text']].copy()

reviews.dropna(subset=['Text'], inplace=True)
reviews.drop_duplicates(subset=['Text'], inplace=True) reviews
= reviews.head(10000).reset_index(drop=True)

print("\n--- Dataset After Cleaning ---") print("Number
of reviews:", len(reviews))

print("\n--- Missing Values ---") print(reviews.isnull().sum())

print("\n--- Duplicate Reviews ---") print(reviews['Text'].duplicated().sum())

display(reviews.head(10))

print("\n" + "=" * 80)
print("TOKENIZATION, LEMMATIZATION AND POS TAGGING") print("="
* 80)

for i, text in enumerate(reviews['Text'].head(5), start=1):

    doc = nlp(text)

    print("\nREVIEW", i)
print("-" * 80)

    print("\nOriginal Review:")
print(text)

    print("\nTokens:")
    print([token.text for token in doc])

    print("\nLemmas:")

Text    0 dtype: int64

--- Duplicate Reviews ---
0
```

Learning Outcome

After completing this experiment, students will be able to preprocess and clean customer review data using Pandas, apply spaCy NLP pipelines to unstructured text, perform tokenization and lemmatization, identify and analyze Part-of-Speech tags, calculate the frequency of major POS categories, perform Named Entity Recognition, extract meaningful entities such as PERSON, ORG, DATE, MONEY, QUANTITY, and PRODUCT when recognized by the selected spaCy model, develop a reusable information extraction function, and organize extracted linguistic information into structured formats for further customer feedback analysis.
